Google Workspace
Business Email Configuration

Technical Project Portfolio

Prepared by: Nandipha Mkhwanazi

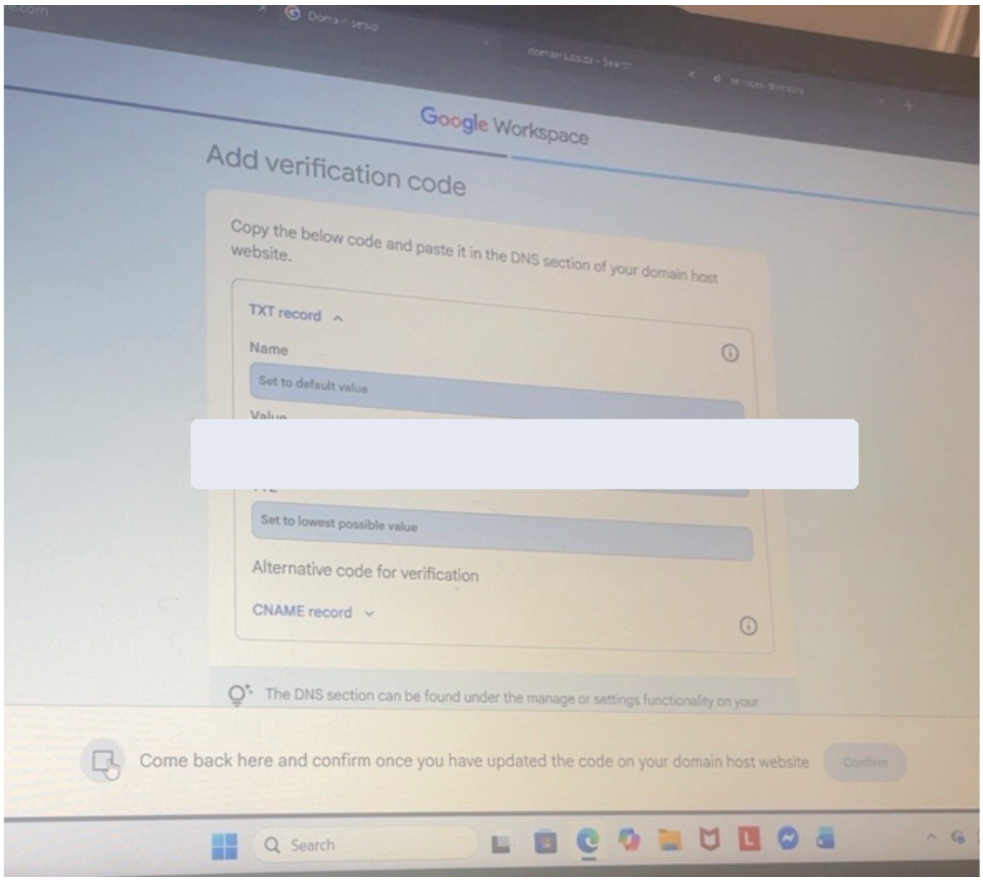

Project focus: Domain verification, DNS administration, email routing, authentication, and troubleshooting

Tools: Google Workspace Admin Console, domain DNS management portal, Gmail

This portfolio documents selected steps of a real business email setup. Screenshots are presented as configuration and troubleshooting evidence, not as a claim that every diagnostic check was complete.

01 Domain verification

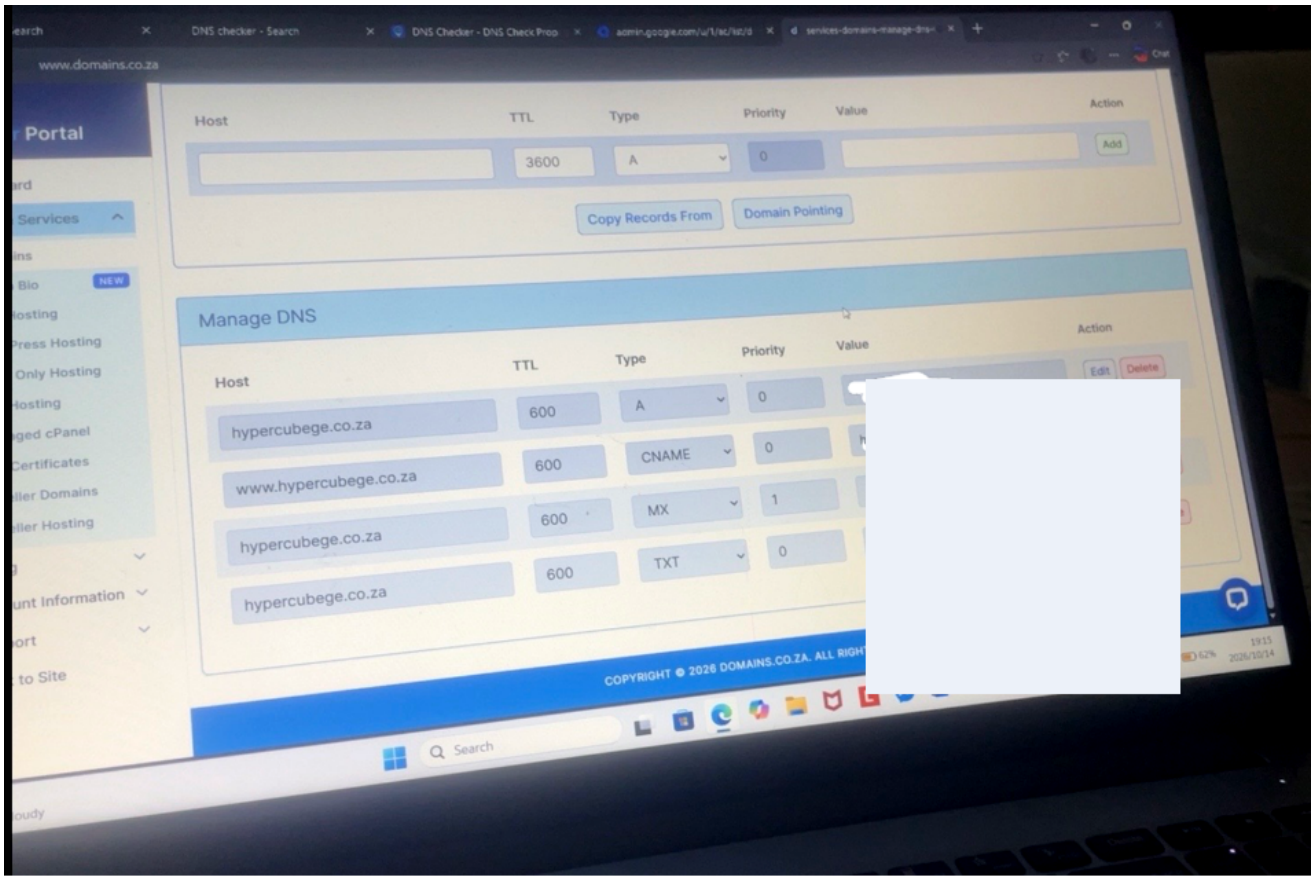

Google Workspace supplied a DNS TXT verification record to establish control of the custom domain. The verification value is obscured in the source screenshot.

Source: user-supplied configuration screenshot; sensitive values may be masked.

02 DNS records management

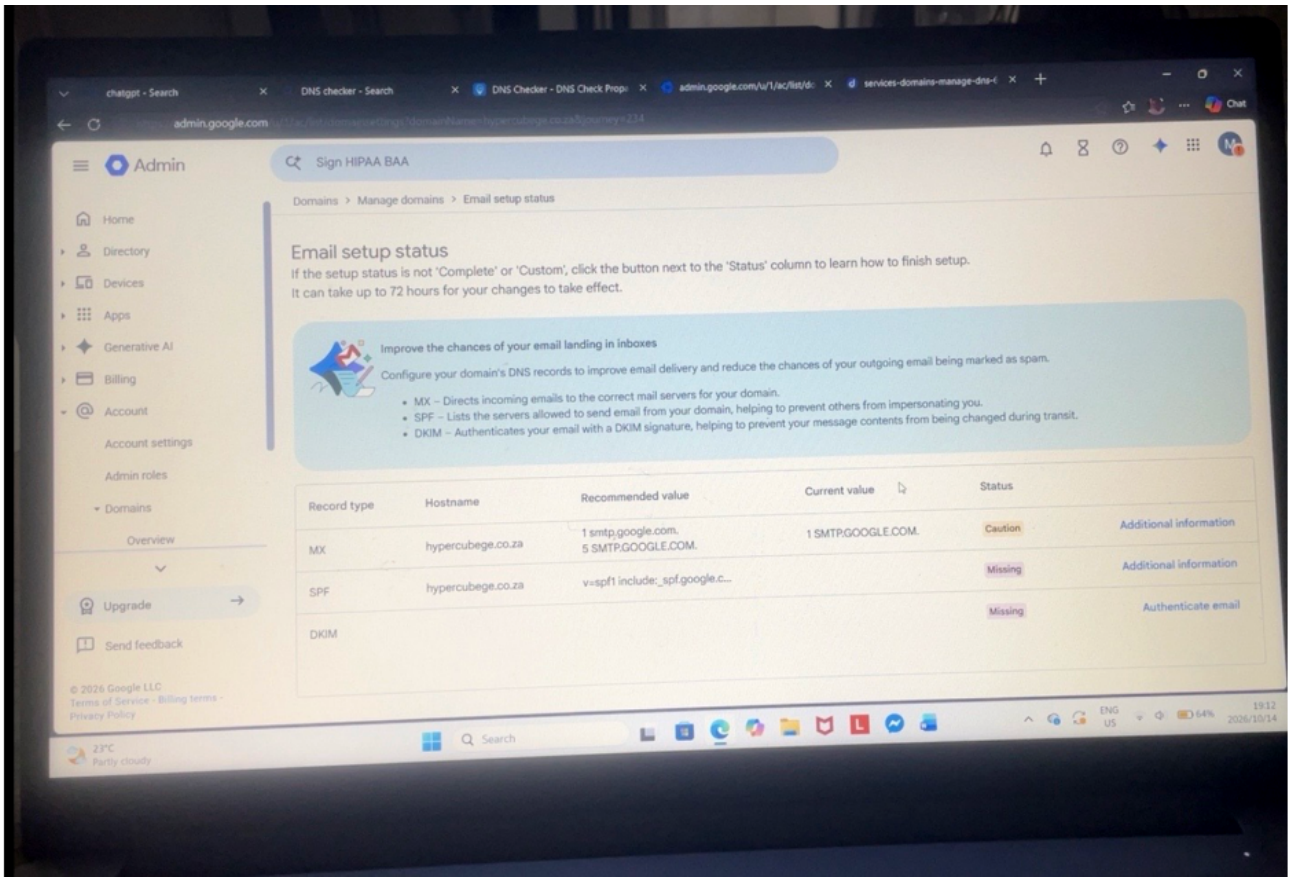

The domain hosting control panel was used to review and edit DNS records, including the mail exchanger (MX) and TXT record types. Some values had already been obscured in the supplied image.

Source: user-supplied configuration screenshot; sensitive values may be masked.

03 Email setup diagnostics

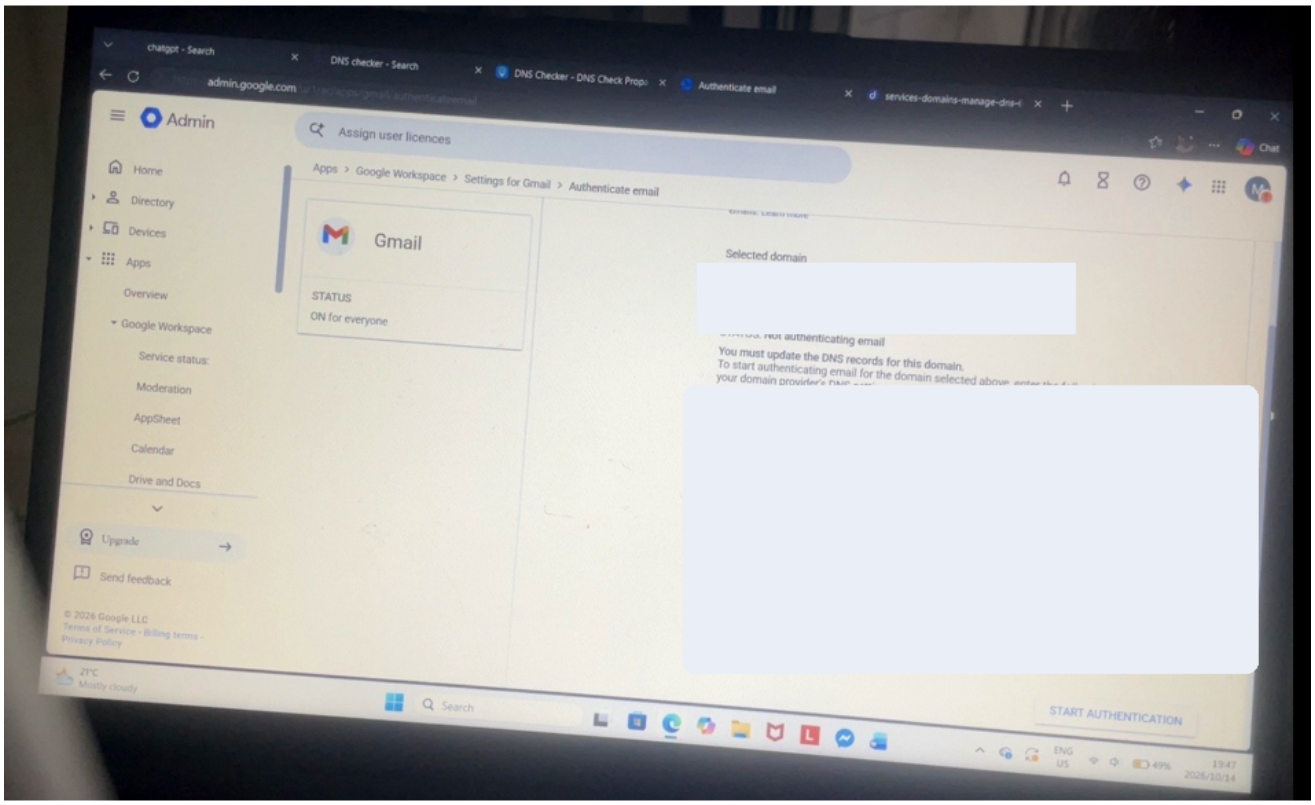

The Google Admin Console displayed email setup checks and indicated that further attention was required for some records. This screenshot documents the diagnostic stage rather than final completion.

04 DKIM authentication configuration

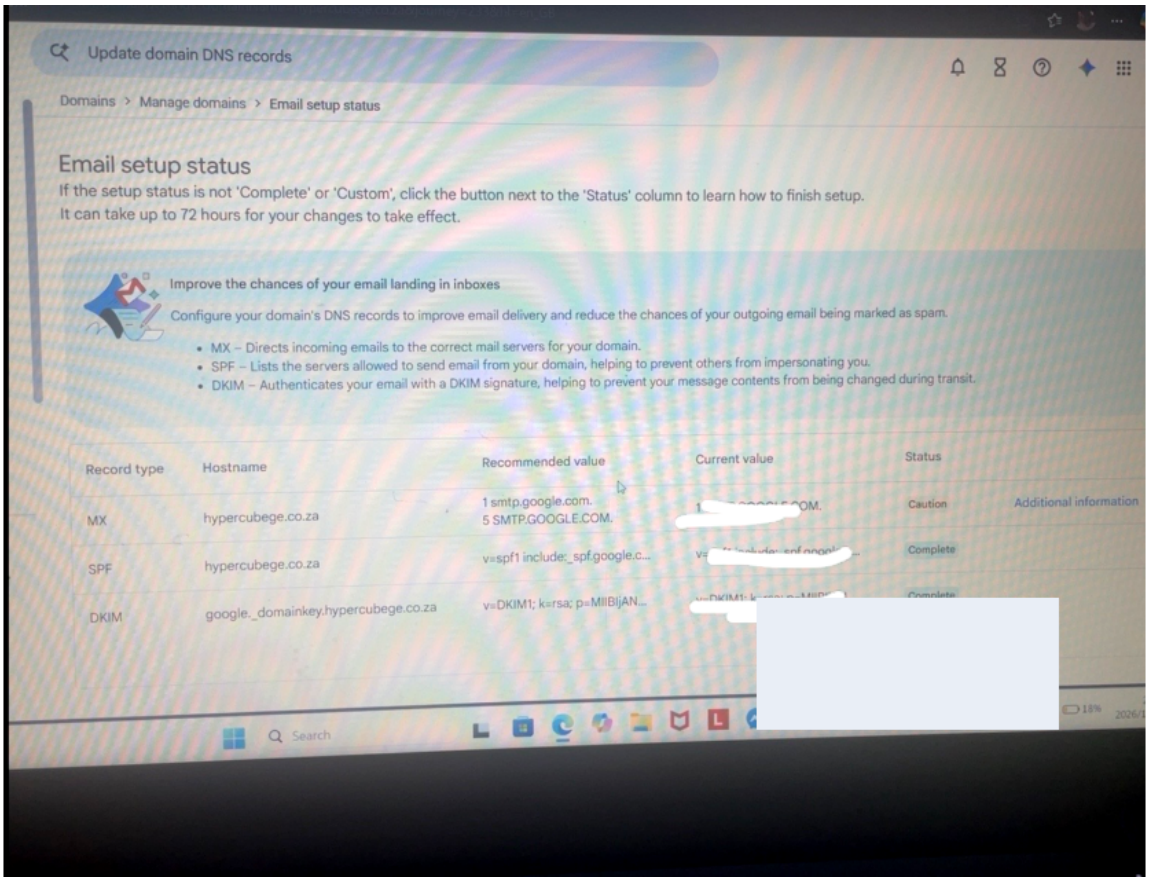

The Google Admin Console displayed instructions for DKIM authentication. The detailed DNS record panel is masked in this portfolio to avoid exposing configuration strings; the image documents the authentication setup workflow.

05 MX, SPF and DKIM status review

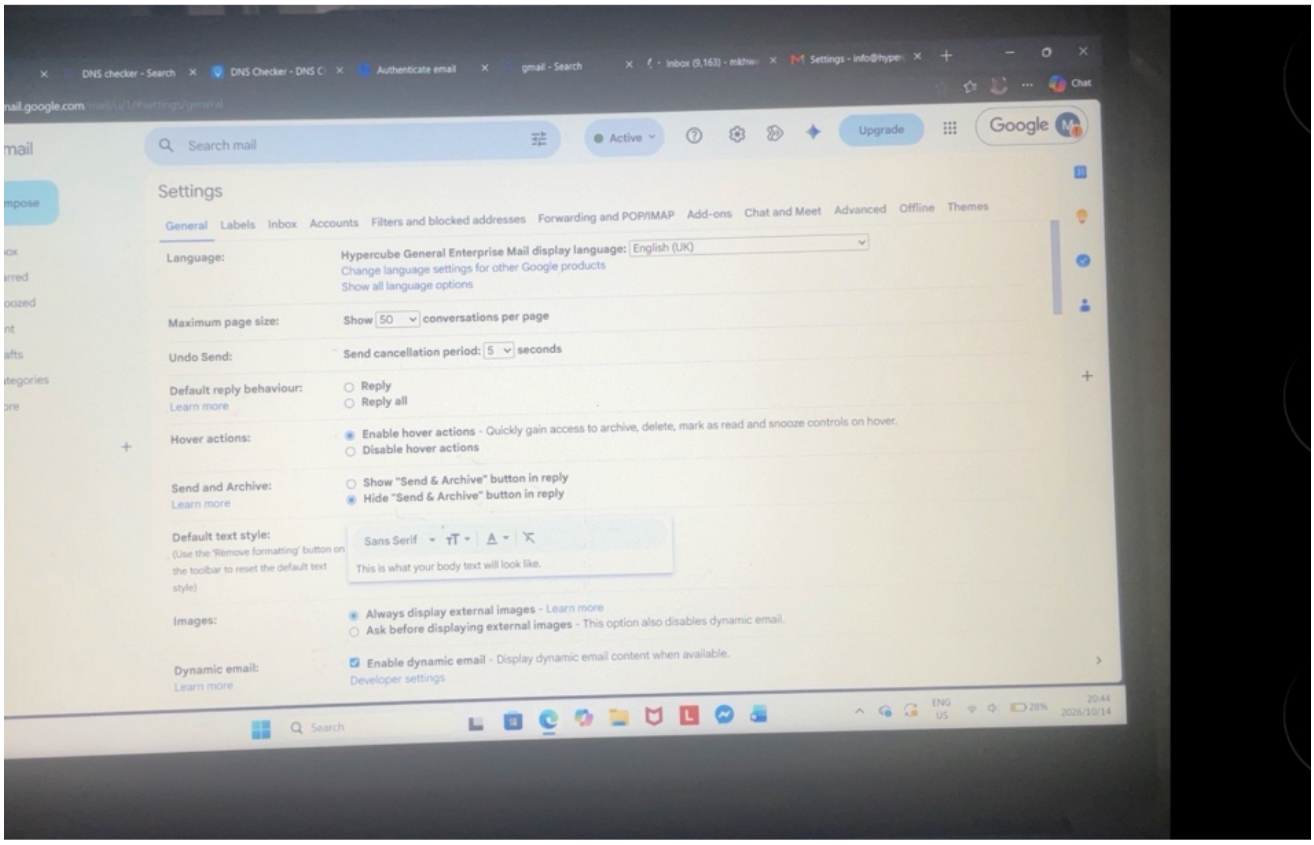

The email status screen shows SPF and DKIM as complete, while MX remained under caution in the captured state. This is a useful example of checking and troubleshooting configuration status.

Source: user-supplied configuration screenshot; sensitive values may be masked.

06 Gmail mailbox settings

The Gmail settings page shows access to mailbox configuration after the setup work. Successful sending and receiving were tested during the project, but this screenshot alone does not prove mail delivery.

Project Summary

Activities documented: Google Workspace domain verification, domain DNS configuration, MX routing review, DKIM setup, SPF/DKIM status checks, and mailbox settings.

Troubleshooting: Reviewed setup diagnostics and updated DNS settings. The captured final status still showed an MX caution, while SPF and DKIM were marked complete.

Outcome: Business mailbox sending and receiving were tested successfully during the project. The screenshots in this PDF document the configuration workflow and visible status checks; they do not independently verify the final live DNS state.

Skills demonstrated: Cloud administration, DNS fundamentals, email authentication, systematic troubleshooting, technical documentation, and privacy-aware reporting.

Prepared for a public technical portfolio. Do not upload unredacted admin screenshots, DNS verification tokens, DKIM private keys, passwords, recovery codes, or private email content.
